

# Can solar power be used to generate electricity at night

## Overview

---

No, solar panels cannot generate electricity at night because they need sunlight to produce power through the photovoltaic effect. Thanks to a new breakthrough, this is no longer a fantasy — scientists have created a photovoltaic (PV) cell that is able to generate power at night through a process known as radiative cooling. Rather than drawing power from the sun, the panel absorbs heat emanating from its own surface as. In most cases, direct sunlight is converted into electricity in one of two ways: using photovoltaic cells, which turn the sun's light into electricity using a semiconductor material that absorbs photons and releases electrons; or using solar-thermal turbines, which use the sun's heat to generate. Luckily, yes, solar panels can still generate power during cloudy days and in the evening hours and we'll explain how. The full answer is far more exciting, because modern solar technology ensures your home stays powered even after sunset. Once the sun sets, they stop generating power, leaving us dependent on batteries or electricity from the grid.
