

# Does the power station generator need to be powered

## Overview

---

The generator needs a mechanical energy source to start working. This usually comes from a combustion engine. A power station, also called a power plant or generating station, is a large-scale industrial facility where electrical power is produced for distribution across an electrical grid. These stations utilize various energy sources—such as coal, natural gas, nuclear, hydroelectric, wind, and solar—to. Understanding power stations helps compare them with generators. It acts as the starting point of the electrical grid system that powers homes, businesses, and industry.
