Olivine: Common Rock-Forming Mineral

How do you identify olivine? Olivine can be easily identified by its olive-green color, glassy luster, absence of cleavage, and its presence in dark-colored rocks such as basalt and peridotite.

Olivine Group , Common Minerals

Description and Identifying Characteristics A distinctive olive-green color, translucent luster and hardness (greater than glass) are usually adequate to distinguish olivine from other minerals. ...

Big 10 Mineral ID

Olivine is typically found in mafic to ultramafic igneous rocks and in their metamorphic equivalents. Less commonly it is found in marbles and a few other metamorphic rock types.

Olivine: Formation, Geology, Properties, and Uses

Olivine is a magnesium-rich silicate mineral formed deep in Earth's mantle. Learn how olivine forms, its geological setting, physical properties, and industrial and gem uses.

Olivine

Olivine is in many ways similar to clinopyroxene. The keys to identifying olivine are its high birefringence, lack of cleavage (but often having fractures), and alteration.
