

Inductive Photovoltaic Inverter

Overview

The three most common types of inverters made for powering AC loads include: (1) pure sine wave inverter (for general applications), (2) modified square wave inverter (for resistive, capacitive, and inductive loads), and (3) square wave inverter (for some resistive). The three most common types of inverters made for powering AC loads include: (1) pure sine wave inverter (for general applications), (2) modified square wave inverter (for resistive, capacitive, and inductive loads), and (3) square wave inverter (for some resistive). Almost any solar systems of any scale include an inverter of some type to allow the power to be used on site for AC-powered appliances or on the grid. Different types of inverters are shown in Figure 11. The available inverter models are now very efficient (over 95% power conversion). Inductive loads requiring high starting currents can significantly affect power sources. Effects of inductive load on PV system were carefully evaluated by deploying an asynchronous motors rated at 7.5kW (10HP, powered). The increasing adoption of photovoltaic (PV) systems in residential, commercial, and industrial applications necessitates a thorough understanding of different types of electrical loads-capacitive, inductive, and resistive-that interact with these systems.
