

# Limit switch for photovoltaic tracking bracket

## Overview

---

Hard limits provide physical end-point protection, ensuring that the solar panels do not exceed a safe range, even in the event of controller failure. Limit switches (such as micro switches) are installed at the extreme left and right ends of the tracking path. Solar trackers continuously adjust the panels' horizontal and height angles (azimuth and elevation). Electric motors with gears or electrohydraulic drives move the panel support. The dual axis solar tracking controller features three inputs and two solid state H-bridge driver outputs. Inputs 1 & 2 are voltage comparators for bi-directional control of direct current loads, input 3 is a window comparator whose output is linked to the Tracking Threshold control and Dark Return. The solar tracker having a bidirectional limit switch device comprises at least one solar panel (10) supported on a pivoting structure (12) tiltable in opposite first and second directions about a rotation axis (13) by a DC electric motor (M) a controller (14) and an actuator (15) controlling. detect magnetic fields through electrical impulses. The pneumatic magnetic series features tools equipped with magnetic cylinders that deliver drive and/or control electrical impulses with the limit switches provided. This technology benefits from increased solar radiation. Experimentally tested using two photovoltaics. The photovoltaics are. Photovoltaic tracking bracket is a supporting device that adjusts the angle in real time to follow the sun's azimuth (east-west direction) and altitude angle (north-south direction) through mechanical and electronic control systems, providing an optimal light-receiving posture for solar panels.
