

New Energy Flywheel Energy Storage Products

Overview

Beacon Power is developing a flywheel energy storage system that costs substantially less than existing flywheel technologies. Flywheels store the energy created by turning an internal rotor at high speeds—slowing the rotor releases the energy back to the grid when needed. You'll appreciate its rapid response time, capable of delivering full power in less than 4. In a quiet engineering lab in Europe, a cylindrical flywheel begins to spin inside a vacuum chamber. Its carbon-fiber rotor reaches thousands of revolutions per minute, humming with stored kinetic energy. When discharging electricity, Spin provides mechanical inertia, which is critical to stabilizing utility grids, microgrids, and power.
