

# PV inverter power limit

## Overview

---

In normal conditions it will choose the maximum power point (MPPT tracking). When attaining one of these limits, the inverter will clip the operating point on the intersection of the I/V curve and this. The inverter input electronics assumes the function of choosing the operating point on the I/V curve of the PV array. This is important because most applications and devices require AC electricity. Our 1200W and 2000W inverters are popular options for people. Figure 6 Solar PV Inverter Settings - Input Limit Checks The inverter parameters outlined below determine the acceptable DC input and AC output limits, as specified by the manufacturer. For example, the MID\_15-25KTL3-X corresponds to a rated AC output power of 15-25KW.
