

Principle of Photovoltaic Offline Inverter System

Overview

Off-grid inverters work on the principle of power electronics, where DC power is converted into AC power by means of an internal electronic circuit. Compared to other sources of energy humankind has harnessed to. Almost any solar systems of any scale include an inverter of some type to allow the power to be used on site for AC-powered appliances or on the grid. Different types of inverters are shown in Figure 11. The control performance and stability of inverters severely affect the PV system, and lots of works have explored how to integrate PV systems with the present power grid.
