

Shine the light on the solar panels

Overview

As the sun shines on a photovoltaic system, sending electricity into the grid, a fair amount of that potential energy is lost as the light hits the ground between rows of panels. The solution is simple, says Pearce: Fill the space with a reflector to bounce sunlight back onto the. Even when the weather is cloudy, solar panels can still generate power from diffused sunlight, making them effective. While the initial costs of solar installation can be high, long-term savings on energy bills and available incentives often offset these costs. In 2023, solar power produced 5.5% of the total global electricity. Joshua Pearce from Michigan Technological University and a team from Queen's University in Canada have found a way to get more sun to shine on the panels and crank up the output.
