

Solar energy storage cooling equipment

Overview

A solar thermal collector is a device that absorbs and transfers heat energy from the sun to an intermediary substance, usually water or air. The heat-transferring fluid (liquid or air) is then employed in building cooling systems to cool indoor spaces. Solar cooling is the process of cooling a space (and/or heat-sensitive appliances) through a solar thermal collector. This method uses available clean energy from the sun to power an alternative refrigeration system instead of using traditional nonrenewable sources such as carbon fuels or. Solar energy can be utilized to sustainably meet much of our space air-conditioning and refrigeration needs due to its accessibility, scalability, and availability as compared to other renewable energy resources, such as wind, geothermal, and hydro (Li et al.
