Overview

One of the most overlooked aspects of solar inverter placement is clearance. Most inverters need at least six inches (15 cm) of space on all sides and above the unit to allow proper airflow. This ventilation prevents heat buildup, which can reduce efficiency and accelerate wear on. Choose a vertical wall capable of supporting the full weight of the Solar Inverter. Electricity traveling long distances through cables experiences resistance, causing voltage drop. That means if your inverter is placed too far from either the panels or the main switchboard, you're literally. SolarEdge inverters can be installed indoors or outdoors, side by side, one above the other, or in a diagonal layout. I've set up several units in different spots and found that airflow, shading, and proximity to panels significantly impact performance and durability. You need to consider factors such as accessibility for maintenance, proximity to the solar panels and electrical panel, as well as ventilation to prevent overheating.
