

Summary of Solar Power Generation and Energy Storage Devices

Overview

Solar photovoltaics (PV) are the main solar energy technology used in distributed solar generation. A single PV device is known as a cell, which typically produces about 1-2 watts. The AES Lawai Solar Project in Kauai, Hawaii has a 100 megawatt-hour battery energy storage system paired with a solar photovoltaic system. Sometimes two is better than one. The reason: Solar energy is not always produced at the time. In the 1830s, British astronomer John Herschel used a solar oven to cook food during an expedition to Africa. Topics in this guide include factors to consider when designing a solar+storage system, sizing a battery system, and safety and environmental considerations, as well as how to value and finance solar+storage. The guide is organized around 12 topic area questions. It allows for capturing and using energy from the sun even during non-sunny periods through innovative storage technologies. Replacing fossil fuel-based power generation with power generation from wind and solar.
