

The latest energy-saving design of outdoor base stations

Overview

Modern base station equipment is designed with energy-saving technologies such as high-efficiency power amplifiers, low-loss cables, and intelligent control systems. Upgrading legacy equipment can reduce energy consumption by 20–40%. The measured results showed that the system ran stably, the temperature inside the cabinet was controlled between 12 °C and 39 °C with no high temperature alarm, the compressor running time was significantly reduced, the. This paper introduces the NEC's energy saving technologies development activities through the end to end O-RAN system which provide the operational benefits for the mobile operators and society by minimizing the energy consumption and carbon emission simultaneously responding to the explosive. The design, age, and specifications of base station components—such as transmitters, power amplifiers, and cooling systems—directly affect overall energy efficiency. In many cases, cooling systems. In today's 5G era, the energy efficiency (EE) of cellular base stations is crucial for sustainable communication. Recognizing this, Mobile Network Operators are actively prioritizing EE for both network maintenance and environmental stewardship in future cellular networks.
