

Vanadium pack battery

Overview

The battery uses vanadium's ability to exist in a solution in four different oxidation states to make a battery with a single electroactive element instead of two. Overview The vanadium redox battery (VRB), also known as the vanadium flow battery (VFB) or vanadium redox flow battery (VRFB), is a type of rechargeable battery which employs vanadium ions as the active material. The battery was first mentioned by P. Van der Pijl in 1930. NASA researchers and Pellegri and Spaziante followed suit in the 1970s, but neither was successful. The first successful VRFB was developed by the University of California, San Diego in 1980. VRFBs' main advantages over other types of battery:

- energy capacity and power capacity are decoupled and can be scaled separately
- energy capacity is obtained from the storage of li.
