

# What is the best way to generate electricity for cold chain containers

## Overview

---

A genset is a portable diesel-powered generator that supplies electricity to a reefer container during transport. It ensures that the container's cooling system stays active when external power sources are unavailable-keeping perishable goods at the correct temperature throughout the. These refrigerated containers need a source of electricity called gensets to function throughout their transportation be it on a vessel, at the terminal, or overland. Genset machines are purpose-built to power reefer containers and have the following features to help users: Gensets are powered by diesel or alternative fuels to generate electricity for the reefer container's cooling system. Modern reefers focus on energy efficiency, using advanced insulation and cooling technologies to minimise. This is where gensets (generator sets) come into play — they are the backbone of reliable power for refrigerated containers, especially when they're detached from fixed power sources. Many are thinking about how to reduce their footprint, but food safety and throughput remain paramount. Modern tools for cold chain facilities are helping some find the holy grail of operational excellence:.
