

# What is the humidity requirement for energy storage containers

## Overview

---

The maximum humidity level for wall battery storage typically ranges between 40% and 60% relative humidity (RH). This range is considered optimal because it minimizes the risk of moisture-related damage while still allowing the batteries to operate efficiently. The general method for temperature management inside an ESS container is to maintain the room temperature near the set temperature, the indoor humidity was in the range of 50. Batteries are electrochemical devices, and their performance is highly sensitive to environmental factors. Extreme temperatures and humidity can accelerate degradation, reduce.
